No Frames Version Student Resources Site Navigation for Student Resources For introductory econometrics courses. Attracting applications to bring the theory and practice of modern econometrics to life Ensure students understand the relevance of econometrics with the introduction of econometrics - a text that connects modern theory and practice with motivation, engaging applications. The 4th edition focuses on currency, based on the philosophy that applications should manage theory, not the other way around. The text includes real-world questions and data, as well as methods that are immediately relevant to applications. With very large datasets increasingly used in economics and related fields, a new chapter on big data helps students learn about this growing and exciting field. This coverage and approach make the subject come alive for students and helps them become sophisticated consumers of econometrics. Also available with MyLab Economy MyLab™ is a learning and learning platform that gives you the opportunity to reach every student. By combining trusted copyright content with digital tools and a flexible platform, MyLab personalizes learning experiences and improves results for each student. The 4th edition has advanced exercise kits in MyLab Economics, offering more flexibility to instructors as they build assignments. Learn more about myLab's economy. Teaching methods through real-world questions and applications, and at the mathematical level is suitable for an introductory course. Modern treatment gives students enough econometric theory to understand the strengths and limitations of the tools, making fit between theory and applications as tight as possible, while keeping the math at a level that requires only algebra. Students learn how to use regressive analysis tools and how to evaluate the validity of empirical analysis through a three-fold process: Immediately after the introduction of the main regression analysis tools, Chapter 9 focuses on the threats to the internal and external validity of empirical research. Further methods of evaluation of empirical research are applied to the constant example in the book. Finally, students get practical practice with reliable datasets, software and empirical exercises. Datasets and software are available through MyLab Economics or www.pearsonhighered.com/stock_watson. Prepare students to work with today's applications and very large data sets, including apps that predict consumer choice and work with non-standard data (such as text data). New - The new chapter 14 is dedicated to the great and machine learning methods. In the economy, many applications focus on the problem of many predictors where predictors large in relation to the sample size. This chapter introduces students to methods that go beyond the usual smaller-square method, which can help them have much lower forecasting errors outside of sampling. New - Chapter 17 expands the focus of many Chapter 14 predictors on time series data. Using a dynamic factor model and a 131-digit suite of quarterly macroeconomic data in the U.S., students learn to predict future values - an important skill to have as econometric professionals. New - Regression is being introduced with parallel forecasting and causal withdrawal treatment to subject students to different requirements about how data can be collected (i.e. randomized versus controlled variables). Keep students engaged with a full range of pedagogical materials, tools and resources updated - Common Interests boxes provide students with an interesting insight into related topics as well as highlighting real-world research. The 4th edition now discusses the historical origin of the regression of instrumental variables (chapter 12). Chapter Introduction provide a real context and a useful roadmap for each chapter to help students navigate the material. Key concept boxes on a regular basis and end chapters summary of key ideas, helping students learn more effectively. Updated - Exercise kits give the instructor flexibility in setting up assignments. Viewing Concept questions allows students to test their understanding. In addition to exercises that provide intensive practice, empirical exercises allow students to apply what they have learned to answer real empirical questions. Reach every student with MyLab Teach your course your way. Your course is unique. So, whether you want to create your own assignments, teach multiple sections or set backgrounds, MyLab gives you the flexibility to easily create your course to suit your needs. Empowerment of each student: Each student learns at a different pace. Personalized learning identifies the exact areas where every student needs practice, providing all students with the support they need - when and where they need it - to be successful. Delivering reliable content: You deserve training materials that meet your own high standards for your course. That's why we with respected authors to develop interactive content and resources that can be trusted and that will overshadow your students. Advanced - The 4th edition has more exercises covering more topics to allow instructors more flexibility in assignment exercises that provide instant, personalized feedback to students. Improving learning outcomes: When you teach with MyLab, student performance improves. That's why teachers have been choosing MyLab for more than 15 years, touching the lives of more than 50 million students. Prepare students to work with today's applications and very large data sets, including apps that predict consumer choice and work with non-standard data (such as text data). The new chapter 14 focuses on big data and machine learning techniques. In the economy, many applications focus on a multi-predictor problem where the number of predictors is large relative to sample size. This chapter introduces students to methods that go beyond the usual smaller-square method, which can help them have much lower forecasting errors outside of sampling. Chapter 17 extends the focus of many Chapter 14 predictors to time series data.
